Service Name

Layer#:Opt Query

Create Monitor Point

The AGS Feature Service monitoring point checks an ArcGIS Server Feature service for layer data and provides a count of the number of records returned.

The script assumes the standard Esri AGS service directory structure (i.e. <your server name>/arcgis/rest/services/<your service name>. If this is not the case, use the [ArcGIS Feature Service URL](#) monitoring point script.

The parameters that are unique to the AGS Feature Service include:

Server Name	DNS name of server where AGS is located
Service Name	Name of REST Feature Service on the ArcGIS server. If service is under a folder is needed (e.g. Parcels or Assessor/Parcels)
Layer#:Opt Query	Default is layer 0 with a query for the number of features Optionally, a different layer number and query can be provided For example, 2:TotalPop > 100,000 would return the number of features in TotalPop field > 100,000

If your AGS Feature Service is secure, use the [AGS Secure Feature Service](#) monitoring point script.
