AGS Map Service WSDL

Monitor Name

Monitor Description

Server Name

Service Name

Create Monitor Point

An AGS Map Service WSDL monitoring point checks to verify that an ArcGIS Server Map Service is running. This monitoring point does not check to verify that a valid (not blank [white]) image is returned.

The parameters that are unique to the AGS Map Service WSDL include:

Server Name	DNS name of server where AGS service is located
Service Name	Name of map service on an ArcGIS server. If service is under a folder, name of folder/services is needed.
