AGS Secure Generic Service Check

Monitor Name

Monitor Description

---

Server Name

Service Name

UserID  Encrypt

UserPW  Encrypt

Service REST URL

Create Monitor Point

The AGS Secure Generic Service Check monitoring point makes a connection to the ESRI HTTPS REST Interface, making a generic request. It does not exercise the service, it only checks to make sure it is present and available. This is a very basic test that can work on any ArcGIS Service.

The parameters that are unique to the AGS Secure Generic Service Check include:

Server Name	DNS name of server where AGS Secure Generic Service is located
Service Name	Name of REST Service on the ArcGIS server. If service is under a folder, name of folder and service is needed (e.g. Parcels or Assessor/Parcels)
UserID	ArcGIS Server Admin user ID using either Windows or ArcGIS Server security <i>Note: UserID should be entered as encrypted information</i>
UserPW	ArcGIS Server Admin user password <i>Note: UserID should be entered as encrypted information</i>
Service REST URL	The end of the URL passed into the check needs to End with the type of AGS Service: /MapServer or /FeatureServer or /GeocodeServer or /ImageServer or /Monitor  <b>Example</b>  <code>https://AnotherTestServer:6443/arcgis/rest/services/Folder/MyServiceName</code>

For non-secured Generic Service Checks, refer to the [AGS Generic Service Check](#) script.
