

# Editing Container Settings

Clicking on the container icon of the container will bring up a panel with details/settings for that container, as shown below.

From left to right at the top are three icons with the following functions:

Open the container's status points dialog

Reset all points inside this container

Delete container

\* **Resetting the container:** Resetting the container will reset every monitor point to run the next engine cycle. Open the Status Points dialog to see the reset points.

---

## Container Name

This is the name of the container.

## Container Description

This is the description of the container.

## Tab

Drop down box to set which tab the container will reside on.

## Governor

This is how many points for the container will be ran at each engine cycle. This is used so to many requests will not be sent at once to a server. Points usually stagger out over normal operations. Adjust as necessary.

## Exclusions

List of any exclusions that have been created on the '[Settings - Exclusions](#)' panel. Note that global exclusions are shown for informational purposes only, and can't be turned off here, since they affect all containers and must be managed in the '[Settings - Exclusions](#)' panel.

In the top right you can change the container's icon. This has no effect other than style.

---

Click **[Save Changes]** when you are satisfied with the settings.
