Service REST URL

Create Monitor Point

The AGS Secure Streaming Service monitoring point checks a Secure ArcGIS Server Streaming Service to monitor. The monitoring point will extract a “ws” (web socket) endpoint from the Esri stream service and perform the check. If the actual ws endpoint is entered, the check will bypass the extraction and perform the check on the ws endpoint.

The parameters that are unique to the Secure ArcGIS Server Streaming Service include:

Server Name	DNS name of server where AGS secure streaming service is located
Service Name	Name of secure streaming service on an ArcGIS Server. If service is under a folder, the folder/service is needed.
userID	User ID using either Windows or ArcGIS Server Security <b>Note:</b> userID should be entered as encrypted information
UserPW	User password <b>Note:</b> userPW should be entered as encrypted information
Service Rest URL	<b>Example:</b> <a href="http://vags103a:6080/arcgis/rest/services/TestStreamService/StreamServer">http://vags103a:6080/arcgis/rest/services/TestStreamService/StreamServer</a>

	<b>Example to directly check web socket endpoint:</b>
--	---

	<code>ws://geoeventsample1.esri.com:6180/arcgis/ws/services/SeattleBus/StreamSe ?outSR=102100</code>
--	--

For non-secured AGS Streaming Services, refer to the [AGS Streaming Service](#) monitoring point script.
