

MS SQL Database/Table

Add a New Monitoring Point

Select Type

MS SQL Database/Table

Monitor Name

Monitor Description

Server Name

Database

Tbl Nm w/Owner

UserID

UserPW

Encrypt

Encrypt

Create Monitor Point

The MS SQL Database/Table monitoring point makes an ODBC connection to the MS SQL Database and checks the table for information.

The parameters that are unique to the MS SQL Database/Table include:

Server Name	DNS name of server where the SQL database is located
Database	Database name to check
Tbl Name w/Owner	Table name to check, including table owner
	Example: GIS.Roads
userID	User ID with access to the MS SQL Table. If using Windows AD authentication Domain\\UserID
	Note: userID should be entered as encrypted information
userPW	User PW for access to the MS SQL Table
	Note: userPW should be entered as encrypted information

Next, configure the GeoMonCharts UI web.config file with the database information added for this monitoring porting, following the instructions in [Editing the Geomonitor UI Web Config for Microsoft Usage Database](#).
