

Find / Replace by Field

Find/Replace values within a Field

The **Find/Replace by Field** button offers more fine-tuned editing of values in a batch fashion. The batch editing process described above replaces the entire value of the field for all selected **Monitoring Points**. There may be cases where this “find and replace” function will be better suited, such as wanting to change a server name within a URL while preserving the rest of the URL parameters which differ across points.

After selecting one or more **Monitoring Points**, click this button and then choose the field that the Find/Replace will operate on. Then enter the text to search for, and the text to replace it with. Note that the search text is case-sensitive. Press OK to apply the change to all selected **Monitoring Points**.

The screenshot shows a dialog box titled "Find/Replace by Field". It has a "Field to Modify" dropdown menu set to "Monitor Description". To the right is a "Search For" field containing "Svc". Below these are two buttons: "Find/Replace by Field" and "Copy Container". At the top right are "OK" and "Cancel" buttons.
