Layer#:Opt Query

Create Monitor Point

The AGS Secure Feature Service monitoring point checks an ArcGIS Server Secure Feature service for layer data and provides a count of the number of records returned.

For non-secured AGS Feature Services, refer to the [AGS Feature Service](#) monitoring point script.

The parameters that are unique to the AGS Secure Feature Service include:

Server Name	DNS name of server where AGS service is located
Service Name	Name of the Rest Feature or Image Service on an ArcGIS Server. If service is name of folder/service is needed.
UserID	ArcGIS Server Admin user ID using either Windows or ArcGIS Server security. <i>Note: UserID should be entered as encrypted information</i>
UserPW	ArcGIS Server Admin user password <i>Note: UserID should be entered as encrypted information</i>
Layer#:Opt Query	Default is layer 0 with a query for the number of features. <i>Example 0,1,2,3:total count>100 would be for layers 0-3 with a count of ></i>
